

## Weblim 2.0 Licensing SDK

**Licensing SDK is a set of APIs that allows easy and simple embedment of license management elements into proprietary software products and applications.**

### Supported Programming Languages

The current versio of SDK supports Java,VB and C++ based applications.

### Session Recovery

Allow users to recover a session interrupted by a broken connection before timeout occurs. Each session has a default time limit and if the session is not timeout, users can recover his work after the restore of communication between license server and client which is broken because of a certain unexpected accident.

### Checkout of Different Releases for Components

Deverlopers can customerize a list of released versions for a specific component and can check out all released version with the list client.

### License Expiration Type

There are two expiration types:

- Perpetual: this category further includes unrenuable license and renewable license. The unrenuable license has no expiration date; The renewable license has a valid period. Users are required to regularly update their renewable licenses.
- Short term: the license validity period can be set to various timeframes such as monthly, yearly or between any start and end dates.

### Node-locked Model

A node-locked license is tied to a designated mac address/host name/user name/stand alone machine.

### Multiple Customer Server Supported

The end user can designate multiple customer servers in the configuration file to pass the jobs to different servers in case the default server falters.

### License Models

There are three distinctive license models:

- Full Floating: licenses can be used by any user at any terminal within the authorized territory;
- Named User Floating: only designated users are allowed to use the licenses;
- Named Host Floating: only computers with designated host names are allowed to use the licenses.

### Support Multi-kind Host ID

- MAC address: physical address of customer server's network adapter.
- ANY: runs anywhere.
- User Name: the user name of customer server.
